

Security

Introduction

This document describes ktsMarketTerminal's security measures covering user data, resilience and accessibility, inherent in its unique ASP (Application Service Provision) technology.

Summary

- High security – all data, including user data, held on database servers on a separate internal network protected by two firewalls.
- High resilience – no single points of failure.
- Accessibility – independent of client access location, ideal for services such as disaster recovery.

The ktsMarketTerminal architecture

ktsMarketTerminal is a powerful cost-effective real-time market information service.

It is unique because of its proprietary next-generation ASP (Application Service Provision) technology. This enables users to connect to ktsMarketTerminal instantly from any PC or laptop via the Internet, with no need for new hardware, software or communications infrastructure.

ktsMarketTerminal security

All data is kept secure by virtue of the database servers being kept on a separate internal network protected by two firewalls. In addition, the centralised server approach removes any necessity for data backup or recovery procedures at the client, and avoids any user handling of the data, for example forwarding by insecure email for access from home.

Our architecture is resilient in that there is no single point of failure. This extends to having two colocation centres, one in the City and one in Docklands, which both replicate the ktsMarketTerminal service in its entirety.

ktsMarketTerminal's unique ASP architecture also means that clients can access the service from practically any location, which makes it ideal for contingency services such as disaster recovery. This access is governed by our proprietary protocol with public-key encryption, and is further protected by there being no need for user data transmission to the server as the data is already stored there.

ktsMarketTerminal is a powerful cost-effective real-time market information service with international coverage.

It is unique because of its proprietary next-generation ASP (Application Service Provision) technology. This enables users to connect to ktsMarketTerminal instantly from any PC or laptop via the Internet, with no need for new hardware, software or communications infrastructure.

ktsMarketTerminal is designed for market professionals who want flexible access to accurate market data. It offers a fast, continuous stream of premium market information, analytics, news, market commentary and research, seamlessly integrated into a single, complete package. Yet an intuitive structure and comprehensive help system make ktsMarketTerminal easy to use.

Have the financial world at your fingertips. Connect to ktsMarketTerminal wherever and whenever you connect to the Internet – at work, on the road, at home – and use the same affordable, reliable service wherever you are.
