Client Engagement Examples

CityVision Symbol Mapper: A Tier 2 client required a solution that would enable data from Bloomberg B-PIPE to be converted in real-time to the Refinitiv format in order to support an existing internal system. Arcontech, working together with the client, delivered a solution within agreed time frames and in two phases to reduce time to deployment. The client subsequently confirmed a significant and ongoing positive impact to their bottom line.

CityVision Excelerator: A Tier 1 client sought to deploy a high performance transport layer for market data across the enterprise. There was a major issue, however, in that their incumbent Excel Add-in used by hundreds of internal consumers of market data was not able to talk to the proposed transport layer.

Arcontech emerged as the clear winner after a six month selection process during which the client tested Exclerator against competitor offerings. Since then Arcontech has worked closely with both the provider of the transport layer and the Tier 1 client to build a bridge to the transport layer via Open MAMA and at the same time further configured Excelerator to meet the specific packaging and internal protocol needs of the Tier 1 client. Excelerator has now been rolled out to over four hundred users at the Tier 1 client on a global basis.

CityVision MVCS: A globally recognised regulatory organisation required a system that would disseminate its critical financial information to the marketplace. Rather than rely on one of the established market data vendors, the Bank required an independent solution that could send the data to the vendors at the same time. Given Arcontech’s track record in this area and that the Arcontech solution was tried and trusted, our software now manages the process to ensure the safe and reliable disclosure of this clients’ information to

the market in a fair and impartial manner.

CityVision API: The multi-asset desk at a Tier 1 client needed a solution to create and price their asset baskets in real-time and to publish those prices to share with others on the desk. As this client was already a user of Excelerator across its organisation, Arcontech was well positioned to assess the traders' needs and, using our API, work with the multi-asset desk developer to build a solution. Excelerator with the API build out is now used by all 20 traders on the multi-asset desk.
